Heart Failure Management System

The ZOLL Heart Failure Management System* (ZOLL HFMS) is designed to help clinicians improve outcomes and reduce hospitalizations for heart failure patients with fluid management problems.

Non-invasive Pulmonary Fluid Level Monitoring

- Novel radiofrequency technology to monitor pulmonary fluid levels, an early indicator for heart failure decompensation
- Continuous monitoring using the non-invasive, water resistant Sensor that can be worn by patients 24 hours a day
- Actionable clinical parameters recorded include Thoracic Fluid Index, heart rate, respiration rate, activity, posture and heart rhythm (ECG)

Alerting Physicians to Signs of Worsening Patient Condition

- Proprietary algorithms determine patient-specific trends in the data, allowing for early detection of deterioration in the patient’s condition
- Certified technicians from ZOLL’s Medicare-approved and Joint Commission-accredited Independent Diagnostic Testing Facility (IDTF) provide 24/7 monitoring and analysis of the patient’s data, along with Weekly and End of Service reports
- Changes in a patient’s trends per pre-defined criteria or physician’s specifications prompt interim notifications to the health care provider
- Data in the notifications aid the physician in the diagnosis and identification of various clinical conditions, events and/or trends, allowing for timely intervention by a medical professional
Heart Failure Readmissions on the Rise

- Every year in the US, more than 650,000 individuals are newly diagnosed with HF.¹
- Heart failure is one of the largest clinical challenges facing healthcare today, affecting nearly 6 million Americans and accounting for 1.2 million hospitalizations every year².
- The current US expenditures for HF exceed $30 billion annually, with 60–80 percent related to hospitalization.

The ZOLL HFMS is designed to help clinicians improve outcomes and reduce hospitalizations for heart failure patients with fluid management problems.
